1 Introduction

this problem asks us to solve a problems

2 Implementation of the model

The model is implemented in `CannibalProblem.java`. Here's my code for `getSuccessors`:

```
public ArrayList<UUSearchNode> getSuccessors() {
    if (this.goalTest()){
        return new ArrayList<UUSearchNode>();
    }
    ArrayList<UUSearchNode> tempList = new ArrayList<UUSearchNode>();
    int new_state = 1-this.state[2];
    int t = (int) Math.pow(-1,this.state[2]);//decide if boat is here or not, if its here

    for(int [] array: possibilities){
        CannibalNode temp = new CannibalNode(this.state[0]+t*array[0], this.state[1]+t*array[1], new_state);
        if(isLegalState(temp,this)){
            tempList.add(temp);
        }
    }
    return tempList;
}
```

The basic idea of `getSuccessors` is...

I used a method `isSafeState` that returns `true` if...

```
private boolean isSafeState(int m, int c) {
    ...
}
```

- 3 Breadth-first search
- 4 Memoizing depth-first search
- 5 Path-checking depth-first search
- 6 Iterative deepening search
- 7 Lossy missionaries and cannibals
